

A scatter plot showing the relationship between a latent variable (x-axis, ranging from -0.4 to 0.8) and a variable representing country codes (y-axis). The plot displays numerous data points, each labeled with a country code. The points are distributed across the plot, with a dense cluster of points on the left side (negative x-values) and a more sparse distribution on the right side (positive x-values). The labels are rotated 45 degrees for readability.
